NOTIHOUSE

Supervisor: PUAN NUR YAHZELINA BINTI HANAFI

Product Description :

NotiHouse system is an ideal solution for smaller home, apartment and condominium. Small business office, factories or home often neglect the security requirement. This system uses an ultrasonic sensor to detect breaches into the house.By using this system,the user will be notified in the event of alarm setting off caused by intrusion on their phone with internet availability.By using BLYNK app,the system will notify the user if there were any intrusion.This system is quite affordable compared to most security alarm system on the market.Our project cost less since the IOT components such as Arduino ESP8266 and ultrasonic sensor has become more affordable over the years.

Problem & Causes :

Too many cases have already happened nowadays because some of the owner house does not use any security system to protect their house.Even in isolated location of the government agencies mostly neglected the security requirement. For example schools nowadays equipped with multimedia equipment. These are often locked in the lab or in the locked stores which is unsecured. The lost of this equipment is far more expensive than the simple security system

Originality & Novelty :

There are many alarm systems that are on the market today that have various functions for the users. Mostly alarm system on the market uses magnetic sensor and PIR(passive infrared(detector). this is because those sensor are more premium and durable. For our device we use ultrasonic sensor to detect motion in the user house. This sensor is cheaper than the PIR and magnetic contact sensor. We also use Arduino Uno to act as main board that will display the output and data through the wifi network.

Eco-Friendly Aspect :

- NotiHouse alarm device is a less power-consuming device.We use simple and small electrical components such as ESP8266,ultrasonic sensor,relay and others.
- Our NotiHouse device is also a compact device. The device is easyto carry by anyone and it is also durable.

Application & Market Potential :

- Our system is among the most affordable and accessible systems for everyone. This is because the goods used are cheap compared to other systems.
- In addition, this system is also easy to carry and install anywhere
- A huge difference between traditional alarm on the market and our alarm system is that our product is internet based,this way the alarm is able to alert users about any intrusions immediately through WIFI technology.

Achievement:

- Developed alarm system based on ultrasonic sensor
- Manage alarm system using Blynk app for device monitoring.
- App developed is able to alert user through push notification and email.
